

- Script Controller UserController (CRUD petugas + anggota)

The image displays two screenshots of a Visual Studio Code editor window, showing the implementation of the `UserController.php` file. The top screenshot shows the `login` and `register` methods. The bottom screenshot shows the `update` method and the `if($validator->fails())` block from the `register` method.

Top Screenshot:

```
class UserController extends Controller
{
    public function login(Request $request)
    {
        $credentials = $request->only('username', 'password');

        try {
            if (! $token = JWTAuth::attempt($credentials)) {
                return response()->json(['error' => 'invalid_credentials'], 400);
            }
        } catch (JWTException $e) {
            return response()->json(['error' => 'could_not_create_token'], 500);
        }

        return response()->json(compact('token'));
    }

    public function register(Request $request)
    {
        $validator = Validator::make($request->all(), [
            'nama_petugas' => 'required|string|max:255',
            'alamat' => 'required|string|max:255',
            'telp' => 'required|string|max:255',
            'username' => 'required|string|max:255',
            'password' => 'required|string|min:6|confirmed',
            'level' => 'required|string|max:255',
        ]);

        if($validator->fails()){
            return response()->json($validator->errors()->toJson(), 400);
        }
    }
}
```

Bottom Screenshot:

```
if($validator->fails()){
    return response()->json($validator->errors()->toJson(), 400);
}

$user = User::create([
    'nama_petugas' => $request->get('nama_petugas'),
    'alamat' => $request->get('alamat'),
    'telp' => $request->get('telp'),
    'username' => $request->get('username'),
    'password' => Hash::make($request->get('password')),
    'level' => $request->get('level'),
]);

$token = JWTAuth::fromUser($user);

$update = User::where('nama_petugas', $request->nama_petugas)->update([
    'nama_petugas' => $request->get('nama_petugas'),
    'alamat' => $request->get('alamat'),
    'telp' => $request->get('telp'),
    'username' => $request->get('username'),
    'password' => Hash::make($request->get('password')),
    'level' => $request->get('level'),
]);

return response()->json(compact('user', 'token'), 201);
}

public function update($id_petugas, Request $req)
{
    $validator = Validator::make($req->all(), [

- Script Controller BukuController

The image displays two screenshots of a Visual Studio Code editor window, showing the implementation of the `BukuController.php` file. The editor is configured with the PHP extension and the file is named `BukuController.php` in the `perpustakaan` project.

Top Screenshot: The editor shows the `store` method implementation. The file explorer on the left indicates the project structure, including `app`, `Http`, `Controllers`, and `Auth` directories. The code in the editor is as follows:

```
namespace App\Http\Controllers;

use Illuminate\Http\Request;
use Illuminate\Support\Facades\Hash;
use Illuminate\Support\Facades\Validator;
use JWTAuth;
use Tymon\JWTAuth\Exceptions\JWTException;
use App\Buku_model;
use Auth;

class BukuController extends Controller
{
    public function store(Request $req)
    {
        $validator=Validator::make($req->all(), [
            'judul'=>'required',
            'penerbit'=>'required',
            'pengarang'=>'required',
            'foto'=>'required'
        ]);

        if($validator->fails()){
            return Response()->json($validator->errors());
        }

        $simpan=Buku_model::create([
            'judul'=>$req->judul,
            'penerbit'=>$req->penerbit,
            'pengarang'=>$req->pengarang,
            'foto'=>$req->foto
        ]);

        if($simpan){

```

Bottom Screenshot: The editor shows the `update` method implementation. The code in the editor is as follows:

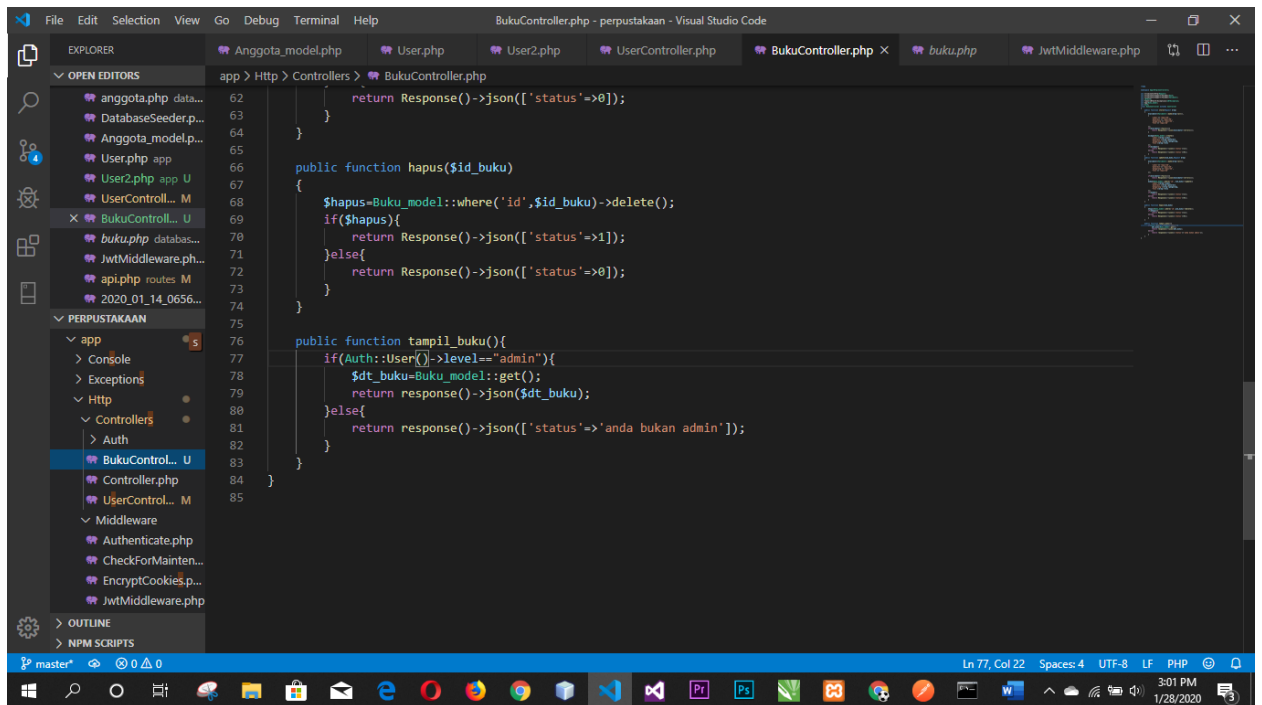

```
        }
    }

    public function update($id_buku,Request $req)
    {
        $validator=Validator::make($req->all(), [
            'judul'=>'required',
            'penerbit'=>'required',
            'pengarang'=>'required',
            'foto'=>'required'
        ]);

        if($validator->fails()){
            return Response()->json($validator->errors());
        }

        $ubah=Buku_model::where('id', $id_buku)->update([
            'judul'=>$req->judul,
            'penerbit'=>$req->penerbit,
            'pengarang'=>$req->pengarang,
            'foto'=>$req->foto
        ]);

        if($ubah){
            return Response()->json(['status'=>1]);
        }else{
            return Response()->json(['status'=>0]);
        }
    }
}
```

- Script Model User.php(Petugas) + User2.php(Anggota)

The image displays two screenshots of the Visual Studio Code editor, showing the implementation of two PHP models: `User.php` (for Petugas) and `User2.php` (for Anggota).

Top Screenshot: `User.php`

```

5 use Illuminate\Notifications\Notifiable;
6 use Illuminate\Contracts\Auth\MustVerifyEmail;
7 use Illuminate\Foundation\Auth\User as Authenticatable;
8 use Tymon\JWTAuth\Contracts\JWTSubject;
9
10 class User extends Authenticatable implements JWTSubject
11 {
12     protected $table="petugas";
13     public $timestamps=false;
14     use Notifiable;
